SAVING IDEAS

An Energy Saving Idea That's Guaranteed

(NAPSA)—By following a few simple tips, it's possible for homeowners to reduce their heating and cooling bills—significantly.

For example, many experts believe installing a low-emissivity, krypton-filled super-insulating window can go a long way toward reducing your home's use of electricity, oil or natural gas.

A simple step, such as installing the right window, can help to reduce energy costs.

For example, one maker of windows that use a Krypton system also pledges that homeowners will see their fuel consumption diminish by 49 percent when they install the windows in their home.

Called the Quantum2, these windows come with a foam-filled vinyl sash and frame that is easy to maintain and helps to create an air-tight seal. Plus, the window tilts in to make cleaning easy.

Available in all styles—including patio doors, garden windows and bay/bow units, the windows are also available with a glazing package that is said to block 99.5 percent of all UV rays.

To learn more, visit the Web site at www.quantum2.net or call 877-RVALUE10.
