Big-Screen Upgrade: TV Or Not TV? That Is The Question

(NAPSA)—With prices falling and technology improving, when you're ready to upgrade to a giant screen for TV, movies and gaming, which is best—a TV or a projector? The short answer is both—because a big-screen TV is best in a bright room for most TV shows, while a projector can provide an engaging home theater experience for watching 3D movies, sports and playing games. Consider the advantages:

A Projector Offers:

- **Image Size:** In general, a projector can produce a larger image at a lower cost than traditional displays.

- **Scalability:** Given the room size, you can choose the perfect image size (ranging from 50" up to 300").

- **Portability:** The projector's lightweight, compact design lets you put it away when not in use.

- **Space:** The projector doesn't take up a lot of space, so you can use it anywhere and even get a giant screen in a small apartment.

- **Decor:** It's small, so the room isn't dominated by an electronic display.

- **Experience:** A superlarge screen creates an immersive experience, just like in a theater, particularly with 3D movies and 3D games that practically come to life around you. With a Mitsubishi projector, you can get exclusive 3D eyewear that provides virtually distortion-free 3D performance.

A Huge-Screen TV Offers:

- **Ambient Light:** TVs create a vivid display, even in rooms with large windows.

- **Supersimple Installation:** TVs are easy to install and set up; simply place the TV where you want it to be, plug in your source devices and power it up—that's it.

- **Size:** The cabinet of one 92" home cinema television is only

Projectors and large-screen TVs offer different advantages to a family looking for the best in home entertainment.

24" deep, so it fits through standard doorways.

- **Technology:** Like the majority of digital cinema projectors used in movie theaters, some huge-screen TVs use DLP technology. It's like bringing the theater home with you. And a cutting-edge technology called LaserVue is made by Mitsubishi Electric, the only TV that uses laser light for more vivid colors compared to other TVs.

- **All in One:** The company's Diamond Series models have a built-in 5.1 sound system for an immersive surround sound experience, plus these high-end models support Bluetooth stereo audio streaming capability, so you can wirelessly stream music from your Bluetooth-enabled music players such as iPod, iPhone, iPad, smartphone or others to your TV.

- **WiFi:** A StreamTV Internet Media feature means you can stream movies from VUDU and connect to social media sites including Facebook and Twitter on your screen.
