Breakthrough Technology Aids Hearing Impaired

(NAPSA)—A new device may be music to the ears of those with significant hearing loss.

It's estimated that as much as 10 percent of the U.S. population has hearing loss to a degree where it interferes with their lives. In extreme cases, hearing loss can lead to isolation and withdrawal from social situations, which has been proven to negatively affect overall health and quality of life.

A new device is designed to enable a listener to easily hear up to three talkers speaking at normal conversation levels.

The new device—called the Companion Mics™ system—is a multi-talker noise-reduction system designed to help people who have difficulty understanding conversations in noisy situations. A listener can easily hear up to three other talkers speaking at normal conversation levels.

The system, based on advanced wireless technology, similar to Bluetooth, was designed by Ety-motic Research, a world leader in high-fidelity, noise-isolating, in-ear earphones.
