

Keeping It Green

(NAPSA)—Pets and winters can be hard on even the best of lawns. And while fertilizer can provide nutrients for growth, it does nothing to improve the condition of soil. Fortunately, there's now an all-natural blend of minerals which conditions the soil and promotes green growth.

When pets “spot” your lawn, a soil conditioner can help undo the damage.

The key ingredient is gypsum, an all-natural soil conditioner that counters the damaging effects of salt, animal waste and compacted clay. It neutralizes damage and actually improves soil density.

According to Dave Jackson of Personal Gardener, a leading line of lawn and garden products, Lawn Spot Repair physically changes the structure of the soil to improve drainage, prevent runoff and erosion, while encouraging deeper, healthier root growth. By improving soil texture, the product also reduces water runoff and makes watering more efficient.
