Oh No! My Computer Crashed
Tips to Prevent PC Problems

(NAPSA)—Today's computers are more than just word processors. We surf the Web, exchange e-mail, burn music CDs, shop online, and view photos. Just like a car, computers need regular maintenance, or they break down and stall, costing both time and money.

Here are some tips to prevent computer problems, brought to you by iolo technologies, developers of System Mechanic utility software.

First, make sure your data files are backed up. Save the original CDs for your programs. If you have downloaded programs, save the original download (before installation) to disk or CD.

Obsolete, temporary junk files and Internet browser history take up critical space on your hard drive. That's why it's important to look for a robust software utilities program like System Mechanic 5 to clean out these files along with cookies and spyware. System Mechanic 5 also has a powerful disk defragmenter, a program uninstaller, an Internet speed booster, a tool to securely delete documents, and a Search and Recover utility that finds and recovers deleted files.

Keep your PC in tiptop shape so you'll never have to say, "My computer crashed!" again.
