

Staying Connected TM Without Connections

(NAPSA)—Tech-savvy people have learned to use wireless technology to get what they want out of the Web—no strings attached.

Today, wireless devices can perform a variety of tasks, ranging from sending and receiving e-mail to accessing bank accounts. In addition, many computer makers offer service and tech support for such devices that rivals their more traditional, grounded counterparts.

For example, Compaq Computer Corporation has a family of wireless products under the umbrella name Evo.

The products represent an entire line of next generation wireless notebooks that feature what is known as MultiPort technology. MultiPort lets users connect wirelessly to the Internet from virtually anywhere, anytime. The technology also lets users wirelessly connect to peripherals such as printers and networks, making it easier to surf or work while on the go.

The computers in the Evo line feature industry leading technology and some (the Thin Client T20, for example) are about the size of a paperback book.

The company backs up its modern family of wireless products with old-fashioned customer service. If a user's notebook is in need of repair, a replacement notebook will be provided within 24 hours. In addition, the company provides an online memory backup to retain important data. For more information visit www.compaq.com.
