

Going Green

Waste To Energy

(NAPSA)—The next time you look at your electricity bill in frustration, you may want to give a thought to a new technology that turns wasted heat energy into electricity. The technology, called Add-Power and developed in Sweden, is now wholly owned by International Power Group, Ltd.

Add-Power converts low-temperature “waste heat” into electricity, reduces the need for oil and has zero impact on the environment.

Clean energy can be produced from solid waste.

International Power Group, Ltd., a Florida-based company, incorporates multiple alternative energy technologies to provide solutions such as Add-Power and Waste-to-Energy, which converts commercial, hazardous, organic and toxic waste into safe, reusable resources.

The company is listed on the OTCBB under the stock symbol IPWG.
